1 SDN Introduction

1.1 Exercise One

Remember previous lab ¹ where you are using host rather than router to emulate some routing functionality. In this experiment we want to implement same functionality with SDN switches. To warm up our hands we will start by simple scenario:

- Open switch.py and read it's codes carefully.
- Run this code with **sudo python switch.py**
- Ping h2 from h1.
- Capture OpenFlow hello packet on **lo** interface. (Filter wireshark output with **of** filter)

Lab Report

- Explain line 21 to 26 of switch.py.
- Read [this link](#) and explain switch handshak with controller. What is xid of your packets. Justify your answer with captured packets. **Don't copy and paste text from refrence in your lab report.**

1.2 Exercise Two

Use what you learned in previous exercise and create figure 1.1 topology. Configure switches in this topology where ??? we can ping each host from each host. Show your final result to instructors.

Figure 1.1: Mininet Topology

2 Exercises with multitables flows

Exercise Three

In this section we are loading switch flows from another files and axamining it's functionality.

- Execute **sudo python topo.py**
- Execute **sh ovs-ofctl add-flows s1 tables.txt** on mininet console.
- Ping each hcost from other hosts.
- Capture ICMP packets on each host and observe network behavior.

¹Lab 4 routing

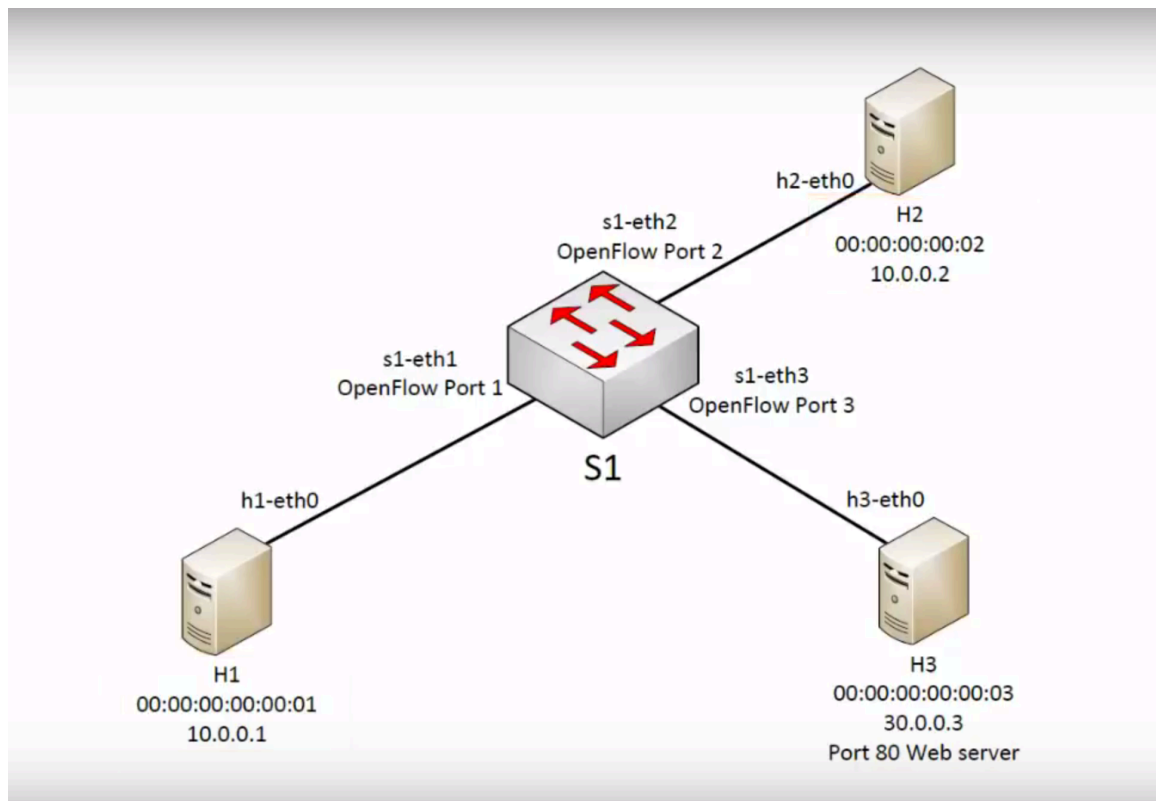

Figure 2.1: Multi Table Scenario

Lab Report

- Can you explain switch behavior? Justify your answer with wireshark output and tables.txt file.
